

Demo Lab Unveils New Look And Enhanced Hardware

Improvements to Empire's test laboratory and demonstration area go beyond fresh looks. This major upgrade of our facility, one of the world's most advanced even before the renovation, represents a serious investment in building for the future.

The test lab and demo center renovation includes a long list of equipment improvements designed for both demonstration and comprehensive testing purposes. For example, the lab's automated cell machine (not shown) now accepts larger parts and processes them with either a pressure- or suction-driven blast stream. Likewise, the lab's 4848 Pro-Finish® cabinet changes over from pressure to suction, or vice versa, with just the flip of a switch. In addition, we've loaded the equipment with more options to accent the full scope of each machine's capabilities.

Although the new equipment and fresh color scheme stand out as two of the most dramatic additions to the lab/demo center, less obvious upgrades, such as better sound attenuation, contribute to more positive customer experiences during demonstrations. In the same vein, expanded ducting for ventilation enables us to operate all systems within the center at the same time.

A closer look at the lab renovation requires no travel. A 360 degree video tour of the facility will soon be available on our web site.

As the lab's capabilities have grown, so have the speed and precision with which Empire test blasts parts. Send yours now.
